**SULFURATED DISTAMYcin DERIVATIVES, PROCESS FOR PREPARING THEM, AND THEIR USE AS ANTITUMOR AGENTS**

The present invention relates to new alkylating antitumor 5 agents analogous to Distamycin A, to a process for their preparation, to pharmaceutical compositions containing them and to their use as therapeutic agents.

Distamycin A, whose formula is reported below

10 belongs to the family of the pyrroleamidine antibiotics and it is reported to interact reversibly and selectively with DNA-AT sequences, thus interfering with both replication and transcription. See, for a reference, *Nature*, 203, 1064 (1964); *FEBS Letters*, 7 (1970) 90; *Prog. Nucleic Acids Res. Mol. Biol.*, 15, 285 (1975).

Several analogous to distamycin are known in the art.

15 DE-A-1795539 discloses distamycin derivatives in which the formyl group is replaced by a hydrogen atom or by the carboxylic acid residue of a C<sub>1</sub>-C<sub>4</sub> aliphatic or 20 cyclopentylpropionic acid.

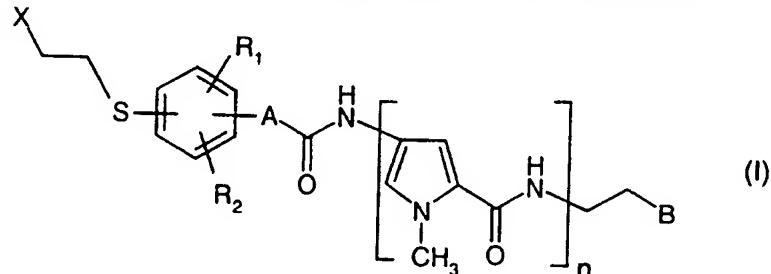

EP-A-246,868 describes distamycin analogues in which the distamycin formyl group is substituted by aromatic, alicyclic or heterocyclic moieties bearing alkylating groups.

25 WO 97/28123 and WO 97/43258 describe distamycin analogues in which the amidino group is replaced with different nitrogen-containing ending groups and the distamycin formyl group is substituted by an aromatic or a cinnamoyl moiety, respectively.

30 It has now been found that a new class of distamycin derivatives as defined hereinunder, wherein the distamycin formyl group is substituted by a phenylcarbonyl, phenylalkylcarbonyl or phenylalkenylcarbonyl group bearing a haloethyl-thio group as an alkylating moiety, and the

amidino group is optionally replaced by various nitrogen-containing ending groups, shows valuable biological properties.

Therefore, the present invention provides compounds which  
5 are sulfurated distamycin derivatives of formula:

wherein:

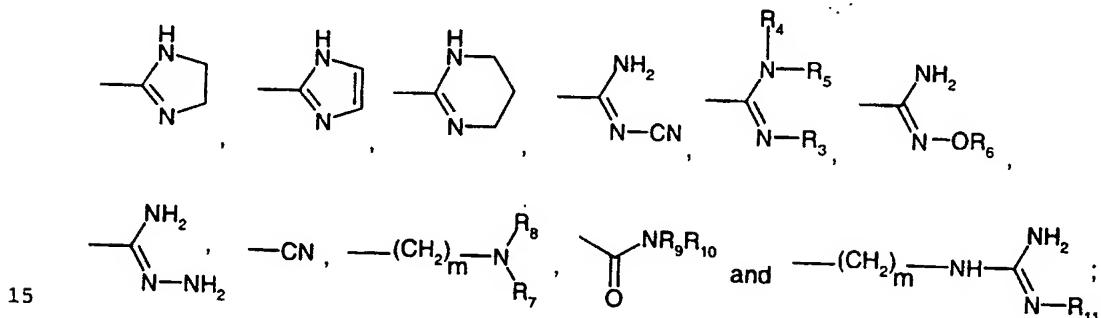

n is 2, 3 or 4;

A is a bond, a C<sub>1</sub>-C<sub>4</sub> alkylene or C<sub>2</sub>-C<sub>4</sub> alkenylene group;

10 R<sub>1</sub> and R<sub>2</sub>, which are the same or different, are selected from hydrogen, C<sub>1</sub>-C<sub>4</sub> alkyl optionally substituted by one or more fluorine atoms, and C<sub>1</sub>-C<sub>4</sub> alkoxy;

X is a halogen atom;

B is selected from:

wherein R<sub>3</sub>, R<sub>4</sub>, R<sub>5</sub>, R<sub>6</sub>, R<sub>7</sub>, R<sub>8</sub>, R<sub>9</sub>, R<sub>10</sub>, and R<sub>11</sub>, which are the same or different, are selected from hydrogen or C<sub>1</sub>-C<sub>4</sub> alkyl; R<sub>11</sub> is hydrogen, C<sub>1</sub>-C<sub>4</sub> alkyl or hydroxy, and m is 0, 1 or 2;  
20 or pharmaceutically acceptable salts thereof.

The present invention includes within its scope also all the possible isomers covered by the compounds of formula (I), both separately and in admixture, as well as the metabolites and the pharmaceutically acceptable bio-precursors (otherwise known as pro-drugs) of the compounds of formula (I).

In the present description, unless otherwise specified, both terms alkyl and alkoxy include straight or branched C<sub>1</sub>-C<sub>4</sub> alkyl and alkoxy groups such as, for instance, methyl, ethyl, n-propyl, isopropyl, n-butyl, isobutyl, sec-butyl, 5 tert-butyl, methoxy, ethoxy, n-propoxy, isopropoxy, n-butoxy, isobutoxy, sec-butoxy and tert-butoxy.

Preferred C<sub>1</sub>-C<sub>4</sub> alkyl or alkoxy groups are methyl, ethyl, methoxy and ethoxy groups.

When substituted by one or more fluorine atoms, the C<sub>1</sub>-C<sub>4</sub> alkyl groups are preferably C<sub>1</sub>-C<sub>4</sub> perfluoroalkyl groups, 10 e.g. trifluoromethyl.

Both terms alkylene and alkenylene refer, respectively, to C<sub>1</sub>-C<sub>4</sub> alkylene or C<sub>2</sub>-C<sub>4</sub> alkenylene groups, as bivalent radicals of the corresponding C<sub>1</sub>-C<sub>4</sub> saturated or C<sub>2</sub>-C<sub>4</sub> 15 unsaturated hydrocarbons.

Preferred alkylene or alkenylene groups according to the present invention are methylene, ethylene or vinylene groups.

The term halogen atom includes fluorine, chlorine, bromine 20 and iodine, being chlorine and bromine preferred.

Within the compounds of formula (I) the haloethyl-thio group and the A group are in ortho, meta or para position with respect to each other; preferably, the haloethyl-thio and A groups are in meta or para position.

25 Pharmaceutically acceptable salts of the compounds of formula (I) are their salts with pharmaceutically acceptable either inorganic or organic acids such as, for instance, hydrochloric, hydrobromic, sulfuric, nitric, acetic, propionic, succinic, malonic, citric, tartaric, 30 methanesulfonic and p-toluenesulfonic acid.

A preferred class of compounds of the present invention is that wherein, in formula (I):

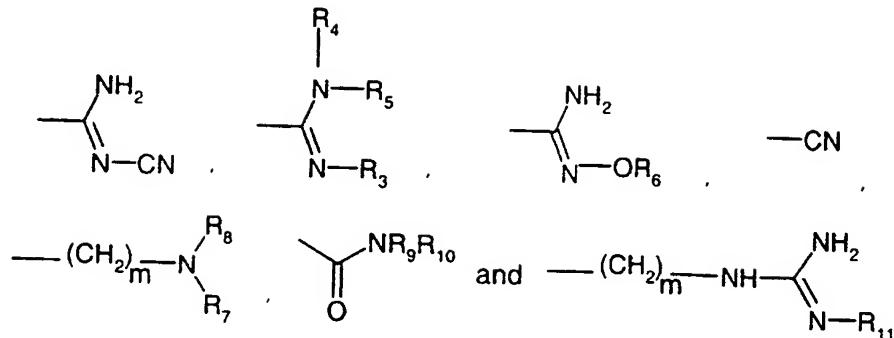

n is 3;

A is a bond or vinylene;

35 R<sub>1</sub> and R<sub>2</sub>, which are the same or different, are selected from hydrogen, methyl, methoxy or trifluoromethyl;

X is chloro or bromo;

B is selected from:

wherein  $R_3$ ,  $R_4$ ,  $R_5$ ,  $R_7$ ,  $R_8$ ,  $R_9$ ,  $R_{10}$  and  $R_{11}$ , which are the same or different, are selected from hydrogen or methyl;  $R_6$  is hydrogen; and  $m$  is 0 or 1;

5 into a pharmaceutically acceptable salt thereof.

In formula (III), Y is hydroxy or a leaving group selected, for instance, from chloro, 2,4,5-trichlorophenoxy, 2,4-dinitro-phenoxy, succinimido-N-oxy, imidazolyl group, and the like.

10 The condensation reactions as set forth above under processes (a) and (b) is carried out according to known methods, for instance those described in the aforementioned EP-A-246,868.

15 The reaction between a compound of formula (II) or (IV) with a compound of formula (III) is preferably carried out with a molar ratio (II):(III) or (IV):(III) of from 1:1 to 1:2.

20 Within the compounds of formula (III) wherein Y is hydroxy, the reaction is carried out in an organic solvent, such as, dimethylsulphoxide, hexamethylphosphotriamide, dimethylacetamide, dimethylformamide, ethanol, phenyl, or pyridine, in the presence of an organic or inorganic base such as triethylamine, diisopropyl ethylamine, or sodium or potassium carbonate or bicarbonate, and of a condensing 25 agent such as, N-ethyl-N'-(3-dimethylamino-propyl)-carbodiimide, N,N'-dicyclohexyl-carbodiimide, or 1-hydroxy-benzotriazole hydrate.

30 The reaction temperature may vary from about -10°C to about 100°C, and the reaction time from about 1 to about 24 hours.

Within the compounds of formula (III) wherein Y is a leaving group as set forth above, the aforementioned condensation reaction may be carried out in an organic

solvent such as, for instance, dimethylformamide, dioxane, pyridine, tetrahydrofuran, or mixtures thereof with water, optionally in the presence of an organic or inorganic base, e.g. N,N'-diisopropylethylamine, triethylamine, sodium or 5 potassium bicarbonate, at a temperature of from about 0°C to about 100°C, and for a time varying from about 2 hours to about 48 hours.

The reaction between a compound of formula (Ia) according to process (a) and one of the reactants as described above 10 at points (i)-(vi) or (ix), can be carried out according to known methods, for instance those reported in US-4,766,142; WO 97/28123; Chem. Revs. 1961, 155; J. Med. Chem. 1984, 27, 849-857; Chem. Revs. 1970, 151; and "The Chemistry of Amidines and Imidates", edited by S. Patai, John Wiley & 15 Sons, N.Y. (1975).

The reaction of a compound of formula (Ia) with succinic anhydride, as defined in point (vii) above, is preferably carried out with a molar ratio (Ia):succinic anhydride of from 1:1 to 1:3 in an organic solvent such as, for 20 instance, dimethyl sulphoxide or dimethylformamide, and in the presence of an organic or inorganic base such as, e.g., triethylamine, diisopropylethylamine, sodium or potassium carbonate, and the like. The reaction temperature may vary from about 25°C to about 100°C, and the reaction time from 25 about 1 hour to about 12 hours.

The reaction with water in an alkaline medium, as defined in points (viii) and (ix) above, may be carried out according to known methods usually employed for alkaline hydrolysis, for instance by treating the substrate with an 30 excess of sodium or potassium hydroxide in water or in a water/organic solvent admixture, e.g. dioxane, tetrahydrofuran, or acetonitrile, at a temperature of from about 50°C to about 100°C, for a time varying from about 2 hours to about 48 hours.

35 The compounds of formula (II) are known or may be prepared according to known methods; see, for a reference, Arcamone et al. in Gazzetta Chim. Ital. 97, 1097 (1967).

Also the compounds of formula (III) are known or may be

prepared according to known methods, for instance by working as described in J. Org. Chem. 1993, 58, 4506-4508 or Helvetica Chimica Acta, Vol. 67, (1984), 1316-1327.

5 The compounds of formula (IV) are known compounds as well, for instance as reported in the aforementioned WO 97/28123. In view of what above reported, it is clear to the man skilled in the art that when preparing the compounds of formula (I) as set forth above, optional amino groups, i.e. R<sub>7</sub> and/or R<sub>8</sub> of the compounds of formula (IV) equal to 10 hydrogen, need to be properly protected according to conventional techniques, so as to avoid unwanted side reactions.

Likewise, the conversion of the said protected amino groups into the free amines may be carried out according to known 15 procedures. See, for a general reference, J. Org. Chem. 43, 2285, (1978); J. Org. Chem. 44, 811 (1979); J. Am. Chem. Soc. 78, 1359 (1956); Ber. 65, 1192 (1932); and J. Am. Chem. Soc. 80, 1154, (1958).

20 Salification of a compound of formula (I), as well as preparation of a free compound starting from a salt, may be carried out by known standard methods.

Well known procedures such as, e.g., fractional 25 crystallisation or chromatography, may also be followed for separating a mixture of isomers of formula (I) into the single isomers.

The compounds of formula (I) may be purified by conventional techniques such as, e.g., silica gel or alumina column chromatography, and/or by recrystallisation from an organic solvent such as, e.g., a lower aliphatic 30 alcohol, e.g. methyl, ethyl or isopropyl alcohol, or dimethylformamide.

#### PHARMACOLOGY

The compounds of formula (I) according to the present 35 invention are useful as antineoplastic agents. Particularly, they show cytostatic properties towards tumor cells, so that they can be useful to inhibit growth of various tumors in mammals, including humans, such as, for

-13-

instance, carcinomas, e.g. mammary carcinoma, lung carcinoma, bladder carcinoma, colon carcinoma, ovary and endometrial tumors. Other neoplasias in which the compounds of the present invention can find application are, for 5 instance, sarcomas, e.g. soft tissue and bone sarcomas, and the hematological malignancies such as, e.g. leukemias.

The in vitro antitumor activity of the compounds of formula (I) was evaluated by cytotoxicity studies carried out on murine L1210 leukemia cells. Cells were derived from in 10 vivo tumors and established in cell culture. The inhibition of cell growth was determined by counting surviving cells with a Coulter Counter after 48 hours treatment.

The in vitro activity was calculated on concentration-response curves and reported as  $IC_{50}$  (concentration 15 inhibiting 50% of the cellular growth in respect to controls) were calculated on dose-response.

The compounds of the invention were tested also in vivo on L1210 murine leukemia and on murine reticulosarcoma M 5076, showing a very good antitumoral activity, with the following 20 procedure.

L1210 murine leukemia was maintained in vivo by i.p. weekly transplantation in CD2F1 female mice, obtained from Charles River Italy. For experiments,  $10^5$  cells/mouse were injected 25 i.v. in the same strain of mice. Animals were 8 to 10 weeks old at the beginning of the experiments. Compounds were administered i.v. at day +1 after tumor cells injections.

M5076 reticulosarcoma was maintained in vivo by i.m. serial transplantation. For experiments,  $5 \times 10^5$  cells/mice were injected i.m. in the same strain of mice. Animals were 8 to 30 10 weeks old at the beginning of the experiments. Compounds were administered i.v. at day 3, 7 and 11 after tumor injection.

Survival time of mice and tumor growth were calculated and activity was expressed in term of T/C% and T.I.%.

35

$$T/C = \frac{\text{median survival time treated group}}{\text{median survival time untreated group}} \times 100$$

T.I.= % inhibition of tumor growth respect to control

Tox = number of mice which died for toxicity.

5 Tox determination was made when mice died before the control and/or tested significant body weight loss and/or spleen and/or liver size reduction were observed.

10 The compounds of the invention can be administered to mammals, including humans, through the usual routes, for example, parenterally, e.g. by intravenous injection or infusion, intramuscularly, subcutaneously, topically or orally. The dosage depends on age, weight and conditions of the patient and on the administration route. For example, a 15 suitable dosage for administration to adult humans may range from about 0.1 to about 150-200 mg pro dose 1-4 times a day.

20 Further object of the present invention are pharmaceutical compositions, which comprise a compound of formula (I) as an active principle, in association with one or more pharmaceutically acceptable carrier and/or diluent.

25 The pharmaceutical compositions of the present invention are usually prepared following conventional methods and are administered in a pharmaceutically suitable form. For instance, solutions for intravenous injection or infusion may contain as a carrier, for example, sterile water or preferably, they may be in the form of sterile aqueous isotonic saline solutions.

30 Suspensions or solutions for intramuscular injections may contain, together with the active compound a pharmaceutically acceptable carrier, e.g. sterile water, olive oil, ethyl oleate, glycols, e.g. propylene glycol, and if desired, a suitable amount of lidocaine hydrochloride.

35 In the forms for topical application, e.g. creams, lotions or pastes for use in dermatological treatment, the active ingredient may be mixed with conventional oleaginous or emulsifying excipients.

The solid oral forms, e.g. tablets and capsules, may contain, together with the active compound, diluents, e.g., lactose, dextrose, saccharose, cellulose, corn starch and potato starch; lubricants, e.g. silica, talc, stearic acid, 5 magnesium or calcium stearate, and/or polyethylene glycols; binding agents, e.g. starches, arabic gums, gelatin, methylcellulose, carboxymethyl cellulose, polyvinyl-pyrrolidone; disaggregating agents, e.g. starch, alginic acid, alginates, sodium starch glycolate; effervescent 10 mixtures; dyestuffs; sweeteners; wetting agents, for instance, lecithin, polysorbates, laurylsulphates; and, in general, non-toxic and pharmacologically inactive substances used in pharmaceutical formulation. Said pharmaceutical preparations may be manufactured by known 15 techniques, for example by means of mixing, granulating, tabletting, sugar-coating or film-coating processes.

Further object of the present invention are the compounds of formula (I) for use in a method for treating the human or animal body by therapy.

20 Furthermore, the present invention provides a method for treating tumors in a patient in need of it, which comprises administering to said patient a composition of the invention.

A further object of the present invention is a combined 25 method for treating cancer or for ameliorating the conditions of mammals, including humans, suffering from cancer, said method comprising administering a compound of formula (I), or a pharmaceutically acceptable salt thereof, and an additional antitumor agent, close enough in time and 30 in amounts sufficient to produce a therapeutically useful effect.

The present invention also provides products containing a compound of formula (I), or a pharmaceutically acceptable salt thereof, and an additional antitumor agent as a 35 combined preparation for simultaneous, separate or sequential use in anti-cancer therapy.

The term "antitumor agent" is meant to comprise both a single antitumor drug and "cocktails" i.e. a mixture of

such drugs, according to the clinical practice. Examples of antitumor agents that can be formulated with a compound of formula (I), or alternatively, can be administered in a combined method of treatment, include doxorubicin,  
5 daunomycin, epirubicin, idarubicin, etoposide, fluorouracil, melphalan, cyclophosphamide, 4-demethoxy daunorubicin, bleomycin, vinblastin, and mitomycin, or mixtures thereof.

10 The following examples are given to better illustrate the present invention but do not limit the scope of the invention itself.
